

As a full-stack developer, you should implement an autocomplete component of cities.

- Do not use any UI libraries such as bootstrap / material etc.
- The UI shouldn't be fancy, but a nice-looking UI will be appreciated.
- The component should be written using Angular.
- The server-side should be written in any of the following (C#, go, Java). C# - advantage
- Bonus - add meaningful unit tests for your work

For your convenience we have attached a sample csv file with cities. (You do not have to use the entire file)
